

One label in your packet is wrong.

Nothing you have already done is wasted. Every competency, table, sequence, concept map and worked problem in the packet is correct. The physiology is right. The only thing wrong is what I called the packet's three sections, and that changes nothing you have written.

Keep working. Staple this page in front of your packet and carry on.

What I got wrong

I called the packet's three sections **Chapter 1, Chapter 2 and Chapter 3**. Silverthorn has chapters with those numbers too, and they are different things. So the packet says "Chapter 3 is how cells send messages" in the same week I asked you to read Silverthorn Chapter 3 for the cell. Two different Chapter 3s. If that confused you, it was the packet, not you.

Read the packet's sections as Parts, not Chapters

In the packet, call it	What it covers
Part 1	The cell and its tissues, the structure
Part 2	Transport across the membrane, what crosses it
Part 3	How cells talk to each other, the signaling

Where the material actually is in Silverthorn

Silverthorn chapter	What Week 2 takes from it
Chapter 3 Compartmentation: Cells and Tissues	The body fluid compartments, and the structure of the membrane itself. Two competencies plus the membrane composition one.
Chapter 5 Membrane Dynamics	Everything that crosses the membrane: diffusion and Fick's law, osmosis, osmolarity and tonicity, facilitated diffusion, the pumps, transport maximum, vesicular transport, transepithelial transport. Fourteen of the twenty five.
Chapter 6 Communication, Integration and Homeostasis	All nine signaling competencies, from signal types through to dose response.

While we are here: ATP

ATP turns up in active transport this week, and in Week 1 when we say a steady state costs ATP every second. In both places it is being **spent**, not taught. The energy chemistry is **Silverthorn Chapter 4**, with its own competencies in the optional review week. You do not need Chapter 4 to do Week 2.

Nothing else changes. Your note sheet and competency list are unaffected, and the copy you printed is fine to work from with this page in front of it. A corrected packet is posted if you want a clean copy, but you do not need it. This page is the whole difference.
